We specialize in providing integrative bio-behavioral healthcare modalities, which blend state of the art technologies with a holistic and humanistic approach.

Our professional staff includes:

Thomas E. Fink, Ph.D., Psychologist

Fees and Billing Information:

A fee schedule is attached. Please refer to it for complete information.

Acorn Health Associates participates in several insurance programs and will bill to insurance carriers with whom we have an on-going professional relationship. These carriers include Capital Blue Cross/Highmark Blue Shield, Medicare, Tricare, and the Commonwealth of Pennsylvania's Office of Vocational Rehabilitation. With written confirmation we will also bill Workers' Compensation and Auto Carriers.

Clients whose carriers are not listed are responsible for payment at the completion of each treatment. We will provide you with information that you need to submit to your carrier for reimbursement. It is the client's responsibility to determine whether the services we provide are covered by their plan.

About EEG Neurofeedback:

EEG Neurofeedback is a special form of therapy designed to develop and enhance brain functioning. The process uses a computer to record and give immediate feedback of brain wave activity. Sensors are placed on the scalp in clinically relevant areas to record brain wave activity and provide feedback to the patient. The computer generates auditory or visual stimulation, which influence certain brain waves. A beginner's manual is enclosed which provides detailed information on the process of EEG Neurofeedback.

EEG Neurofeedback is designed to strengthen cognitive brain function so that a person can benefit from individual and group therapies. Individuals become more responsive to medication and behavioral therapies are more effective. Assisting in the reduction and elimination of potentially harmful psychotropic medications is one of the primary goals of this practice.

A session can last from 45 to 60 minutes. Sessions may take place once or twice a week and can range from 20-60 in number, or more, depending on the complexity of the clinical condition.

Computer generated statistics can readily show progress, but clinical changes may be subtle at first, and take 20-40 sessions before behavioral progress is noticeable.
